ShopEase — Task 4: Mini Project / Clickable Prototype

CodeAlpha UI/UX Design Internship

ShopEase is a mobile-first e-commerce prototype designed to demonstrate a short and understandable purchase journey. The prototype focuses on navigation and interaction rather than backend functionality.

1. Prototype Objective

The objective is to allow a first-time user to discover a product, view product information, add the product to the cart, change quantity, proceed through checkout, and receive clear order confirmation.

2. Primary User Flow

Home → Product Details → Cart → Checkout → Order Confirmation

3. Interaction Specification

Screen	User action	Expected result
Home	Tap product	Product Details opens
Product Details	Tap Add to Cart	Product is added and Cart opens
Cart	Tap + / –	Quantity and total update
Cart	Tap Proceed to Checkout	Checkout opens
Checkout	Tap Place Order	Confirmation opens
Confirmation	Tap Continue Shopping	Returns to Home

4. Design Explanation

The experience starts with product discovery and uses progressive disclosure: essential information is shown first, while detailed information is available after selecting a product. The cart keeps price and quantity visible. Checkout separates delivery address, payment method, and order review into predictable sections. The confirmation screen provides immediate feedback and a clear return path.

5. UI/UX Principles Applied

Consistency, visibility of system status, clear affordances, recognition over recall, minimal cognitive load, readable typography, accessible contrast, mobile-friendly touch targets, and a predictable checkout sequence.

6. Usability Testing Checklist

A first-time user should be able to: find a product, understand its price, add it to the cart, change quantity, reach checkout, and understand that the order was completed. During testing, record completion time, errors, hesitation points, and user comments.

7. Prototype Deliverable

The accompanying HTML file is a self-contained clickable prototype. Open it in a browser and demonstrate the complete shopping journey. This prototype is intended to demonstrate UI/UX interactions and does not require a real backend, payment gateway, or database.
